

# Compression results – ATB

PARAMETERS: AGC with `-a -b 500 -s 1500`; MBGC with `-m 3`. All with 25 threads. In this experiment, all batches of MiniPhy2 have 4000 genomes. Compression error on 1 batch (unknown\_002). With MBGC batch unknown\_002 couldn't compress, and with AGC, batch unknown\_002 is corrupted after compression. Max unknown batch size for MBGC is approx 720MB, AGC unknown\_002 is approx 2GB.
