

Compression results – ATB

PARAMETERS: AGC with `-a -b 500 -s 1500`; MBGC with `-m 3`. All with 25 threads. In this experiment, all batches of MiniPhy2 have 4000 genomes. Compression error on 1 batch (unknown_002). With MBGC batch unknown_002 couldn't compress, and with AGC, batch unknown_002 is corrupted after compression. Max unknown batch size for MBGC is approx 720MB, AGC unknown_002 is approx 2GB.
